**4-(2-Phenylsulfanyl-phenyl)-1,2,3,6-tetrahydropyridine derivatives as serotonin reuptake inhibitors**

The present invention relates to novel compounds which are serotonin reuptake  
5 inhibitors and as such effective in the treatment of for example depression and anxiety.

**Background of the invention**

- 10 Selective serotonin reuptake inhibitors (hereinafter referred to as SSRIs) have become first choice therapeutics in the treatment of depression, certain forms of anxiety and social phobias, because they are effective, well tolerated and have a favourable safety profile compared to the classic tricyclic antidepressants.
- 15 However, clinical studies on depression indicate that non-response to SSRIs is substantial, up to 30%. Another, often neglected, factor in antidepressant treatment is compliance, which has a rather profound effect on the patient's motivation to continue pharmacotherapy.
- 20 First of all, there is the delay in therapeutic effect of SSRIs. Sometimes symptoms even worsen during the first weeks of treatment. Secondly, sexual dysfunction is a side effect common to all SSRIs. Without addressing these problems, real progress in the pharmacotherapy of depression and anxiety disorders is not likely to happen.
- 25 In order to cope with non-response, psychiatrists sometimes make use of augmentation strategies. Augmentation of antidepressant therapy may be accomplished through the co-administration of mood stabilizers such as lithium carbonate or triiodothyronin or by the use of electroshock.
- 30 The effect of combined administration of a compound that inhibits serotonin reuptake and a 5-HT<sub>1A</sub> receptor antagonist has been evaluated in several studies (Innis et al. *Eur. J. Pharmacol.* 1987, 143, 1095-204 and Gartside *Br. J. Pharmacol.* 1995, 115, 1064-1070, Blier et al. *Trends in Pharmacol. Science* 1994, 15, 220). In these studies,

it was found that 5-HT<sub>1A</sub> receptor antagonists would abolish the initial brake on 5-HT neurotransmission induced by the serotonin reuptake inhibitors and thus produce an immediate boost of 5-HT transmission and a rapid onset of therapeutic action.

- 5 Several patent applications have been filed, which cover the use of a combination of a 5-HT<sub>1A</sub> antagonist and a serotonin reuptake inhibitor for the treatment of depression (see e.g. EP-A2-687472 and EP-A2-714663).

Another approach to increase terminal 5-HT would be through blockade of the 5-HT<sub>1B</sub> autoreceptor. Microdialysis experiments in rats have indeed shown that increase of hippocampal 5-HT by citalopram is potentiated by GMC 2-29, an experimental 5-HT<sub>1B</sub> receptor antagonist.

15 Several patent applications covering the combination of an SSRI and a 5-HT<sub>1B</sub> antagonist or partial agonist have also been filed (WO 97/28141, WO 96/03400, EP-A-701819 and WO 99/13877).

It has previously been found that the combination of a serotonin reuptake inhibitor 20 with a compound having 5-HT<sub>2C</sub> antagonistic or inverse agonistic effect (compounds having a negative efficacy at the 5-HT<sub>2C</sub> receptor) provides a considerable increase in the level of 5-HT in terminal areas, as measured in microdialysis experiments (WO 01/41701). This would imply a shorter onset of antidepressant effect in the clinic and an augmentation or potentiation of the therapeutic effect of the serotonin reuptake inhibitor (SRI).

25 The combined effect of serotonin reuptake inhibition and norepinephrine uptake inhibition on depression is explored in clinical studies of compounds such as Duloxetine (Wong, Duloxetine (LY-248686): an inhibitor of serotonin and noradrenaline uptake and an antidepressant drug candidate *Expert Opinion on Investigational Drugs*, 1998, 7, 10, 1691-1699) and Venlafaxine (Khan-A et al, Venlafaxine in depressed outpatients *Psychopharmacology Bulletin*, 1991, 27, 141-144).

The present invention provides compounds which are serotonin reuptake inhibitors. Some of the compounds also have a combined effect of serotonin reuptake inhibition and 5-HT<sub>2C</sub> receptor modulation, which according to WO01/41701 would imply a faster onset of antidepressant activity. Moreover, some of the compounds posses the combined effect of serotonin reuptake inhibition and norepinephrine uptake inhibition. Basically, the present compounds are suitable for the treatment of affective disorders, such as depression, anxiety disorders including general anxiety disorder, social anxiety disorder, post traumatic stress disorder, obsessive compulsive disorder, panic disorder, panic attacks, specific phobias, social phobia and angoraphobia.

### Pharmaceutical compositions

10

The compounds of the invention may be administered alone or in combination with pharmaceutically acceptable carriers or excipients, in either single or multiple doses. The pharmaceutical compositions according to the invention may be formulated with pharmaceutically acceptable carriers or diluents as well as any other known adjuvants 15 and excipients in accordance with conventional techniques such as those disclosed in Remington: The Science and Practice of Pharmacy, 19 Edition, Gennaro, Ed., Mack Publishing Co., Easton, PA, 1995.

20 The pharmaceutical compositions may be specifically formulated for administration by any suitable route such as the oral, rectal, nasal, pulmonary, topical (including buccal and sublingual), transdermal, intracisternal, intraperitoneal, vaginal and parenteral (including subcutaneous, intramuscular, intrathecal, intravenous and intradermal) route, the oral route being preferred. It will be appreciated that the preferred route will depend on the general condition and age of the subject to be

treated, the nature of the condition to be treated and the active ingredient chosen.

Pharmaceutical compositions for oral administration include solid dosage forms such as capsules, tablets, dragees, pills, lozenges, powders and granules. Where

5 appropriate, they can be prepared with coatings such as enteric coatings or they can be formulated so as to provide controlled release of the active ingredient such as sustained or prolonged release according to methods well known in the art.

Liquid dosage forms for oral administration include solutions, emulsions,

10 suspensions, syrups and elixirs.

Pharmaceutical compositions for parenteral administration include sterile aqueous and nonaqueous injectable solutions, dispersions, suspensions or emulsions as well as sterile powders to be reconstituted in sterile injectable solutions or dispersions prior to

15 use. Depot injectable formulations are also contemplated as being within the scope of the present invention.

Other suitable administration forms include suppositories, sprays, ointments, creams, gels, inhalants, dermal patches, implants etc.

20

A typical oral dosage is in the range of from about 0.001 to about 100 mg/kg body weight per day, preferably from about 0.01 to about 50 mg/kg body weight per day, and more preferred from about 0.05 to about 10 mg/kg body weight per day administered in one or more dosages such as 1 to 3 dosages. The exact dosage will

25 depend upon the frequency and mode of administration, the sex, age, weight and general condition of the subject treated, the nature and severity of the condition treated and any concomitant diseases to be treated and other factors evident to those skilled in the art.

30

The formulations may conveniently be presented in unit dosage form by methods known to those skilled in the art. A typical unit dosage form for oral administration one or more times per day such as 1 to 3 times per day may contain from 0.01 to about 1000 mg, preferably from about 0.05 to about 500 mg, and more preferred from

about 0.5 mg to about 200 mg.

For parenteral routes such as intravenous, intrathecal, intramuscular and similar administration, typically doses are in the order of about half the dose employed for

5 oral administration.

The compounds of this invention are generally utilized as the free substance or as a pharmaceutically acceptable salt thereof. One example is an acid addition salt of a compound having the utility of a free base. When a compound of the formula (I)

10 contains a free base such salts are prepared in a conventional manner by treating a solution or suspension of a free base of the formula (I) with a chemical equivalent of a pharmaceutically acceptable acid. Representative examples are mentioned above.

For parenteral administration, solutions of the novel compounds of the formula (I) in

15 sterile aqueous solution, aqueous propylene glycol, aqueous vitamin E or sesame or peanut oil may be employed. Such aqueous solutions should be suitably buffered if necessary and the liquid diluent first rendered isotonic with sufficient saline or glucose. The aqueous solutions are particularly suitable for intravenous,

intramuscular, subcutaneous and intraperitoneal administration. The sterile aqueous

20 media employed are all readily available by standard techniques known to those skilled in the art.

Suitable pharmaceutical carriers include inert solid diluents or fillers, sterile aqueous solution and various organic solvents. Examples of solid carriers are lactose, terra

25 alba, sucrose, cyclodextrin, talc, gelatine, agar, pectin, acacia, magnesium stearate, stearic acid and lower alkyl ethers of cellulose. Examples of liquid carriers are syrup, peanut oil, olive oil, phospho lipids, fatty acids, fatty acid amines, polyoxyethylene and water. Similarly, the carrier or diluent may include any sustained release material

known in the art, such as glycetyl monostearate or glycetyl distearate, alone or mixed 30 with a wax. The pharmaceutical compositions formed by combining the novel compounds of the formula (I) and the pharmaceutical acceptable carriers are then readily administered in a variety of dosage forms suitable for the disclosed routes of administration. The formulations may conveniently be presented in unit dosage form

by methods known in the art of pharmacy.

- Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules or tablets, each containing a predetermined amount of the active ingredient, and which may include a suitable excipient. Furthermore, the orally available formulations may be in the form of a powder or granules, a solution or suspension in an aqueous or non-aqueous liquid, or an oil-in-water or water-in-oil liquid emulsion.
- If a solid carrier is used for oral administration, the preparation may be a tablet, placed in a hard gelatine capsule in powder or pellet form or it can be in the form of a troche or lozenge.
- The amount of solid carrier will vary widely but will usually be from about 25 mg to about 1 g.

If a liquid carrier is used, the preparation may be in the form of a syrup, emulsion, soft gelatine capsule or sterile injectable liquid such as an aqueous or non-aqueous liquid suspension or solution.

The diazotation followed by reaction with a thiophenol IV according to the method b) can be performed by addition of the diazonium salt of the corresponding aniline to a solution of sodium salt of a thiophenol in an aqueous suspension of copper. The starting material of formula III and the corresponding diazonium salt can be prepared by methods analogues to those described in the literature (e.g. Berridge, M. S. et al. *J. Med. Chem.* 1993, 36, 1284-1290). Thiophenols of the formula IV are either commercially available or can be prepared according to methods described in standard works such as Houben-Weyl, Methoden der organischen Chemie (Methods of

Organic Chemistry), Georg-Thieme-Verlag, Stuttgart; Organic Reactions, John Wiley & Sons, Inc. New York, namely under reaction conditions such as those which are known and suitable for such reactions.

For ion-exchange chromatography, the following material was used: SCX-columns (1 g) from Varian Mega Bond Elut®, Chrompack cat. No. 220776. Prior to use, the SCX-columns were pre-conditioned with 10% solution of acetic acid in methanol (3 mL). For de-complexation by irradiation, a ultraviolet light source (300 W) from Philippss was used. As starting polymer supports for solid phase synthesis, Wang-resin (1.03 mmol/g, Rapp-Polymer, Tuebingen, Germany) was used.

### Preparation of Intermediates

#### 4-Hydroxy-4-[2-(4-chlorophenylsulfanyl)phenyl]-piperidine-1-carboxylic acid *tert*-butyl ester.

A solution of BuLi (2.5 M in hexane, 12.0 ml, 30 mmol) was slowly added to a stirred solution of 1-bromo-2-(4-chlorophenylsulfanyl)benzene (30 mmol) in dry THF (75 ml) under Argon at -78 °C. The solution was stirred for 10 min before 4-oxo-piperidine-1-carboxylic acid *tert*-butyl ester (5.98 g, 30 mmol) was added in one portion. The solution was allowed to warm up to room temperature and then stirred for 3 h. Saturated aqueous NH<sub>4</sub>Cl (150 ml) was added and the solution was extracted with ethylacetate (150 ml). The organic phase was washed with brine, dried (MgSO<sub>4</sub>) and the solvent was evaporated *in vacuo*. Crude product was purified by flash chromatography on silica gel (eluent: Ethylacetat/heptane 20:80) to produce the target compound as a white foam. #### Measurements of [<sup>3</sup>H]-5-HT uptake into rat cortical synaptosomes.

Whole brains from male Wistar rats (125-225 g), excluding cerebellum, are homogenized in 0.32 M sucrose supplemented with 1mM nialamid with a glass/teflon homogenizer. The homogenate is centrifuged at 600 x g for 10 min at 4 °C. The pellet is discarded and the supernatant is centrifuged at 20.000 x g for 55 min. The final pellet is homogenized (20 sec) in this assay buffer (0.5 mg original tissue/well). Test compounds (or buffer) and 10 nM [<sup>3</sup>H]-5-HT are added to 96 well plates and shaken briefly. Composition of assay buffer: 123 mM NaCl, 4.82 mM KCl, 0.973 mM CaCl<sub>2</sub>, 1.12 mM MgSO<sub>4</sub>, 12.66 mM Na<sub>2</sub>HPO<sub>4</sub>, 2.97 mM NaH<sub>2</sub>PO<sub>4</sub>, 0.162 mM EDTA, 10 mM glucose and 1 mM ascorbic acid. Buffer is oxygenated with 95% O<sub>2</sub>/5% CO<sub>2</sub> for 10 min at 37 °C and pH is adjusted 7.4. The incubation is started by adding tissue to a final assay volume of 0.2 mL. After 15 min incubation with radioligand at 37 °C, samples are filtered directly on Unifilter GF/C glass fiber filters (soaked for 1 hour in 0.1%

polyethylenimine) under vacuum and immediately washed with 3 x 0.2 ml assay buffer. Non-specific uptake is determined using citalopram (10  $\mu$ M final concentration). Citalopram is included as reference in all experiments as dose-response curve.

- 5 Preferred compounds of the present invention exhibit serotonin reuptake inhibition below 200 nM ( $IC_{50}$ ) in the assay above. More preferred are the compounds which exhibit inhibition below 100 nM and most preferably below 50 nM.

**[ $^3$ H]Mesulergine binding to 5-HT<sub>2C</sub> receptors.**

- 10 Cell lines expressing 10-20 pmol/mg protein human 5-HT<sub>2C</sub>-vsv receptors (Euroscreen) were harvested in ice-cold 50 mM Tris pH 7.7 buffer containing 125 mM NaCl and stored at -80 ° C. On the day of the experiment cells were quickly thawed and homogenized in 50 mM Tris pH 7.7 using an Ultra-Thurax. Aliquots consisting of 6-30  $\mu$ g protein, [ $^3$ H]Mesulergine (1 nM) and testsubstance were incubated for 30 min  
15 at 37° C. Total binding was determined using assay buffer (50 mM Tris pH 7.7) and non-specific binding was defined in the presence of 100  $\mu$ M 5-HT. Bound and free [ $^3$ H]Mesulergine was separated by vacuum filtration on GF/B filters (pre-soaked in 0.1% PEI for ½ hour) and counted in a scintillation counter.

20 **5-HT<sub>2C</sub> receptor efficacy as determined by fluorometry.**

- This assay was carried out as described by Porter et al. *British Journal of Pharmacology* 1999, 128, 13 with the modifications described below. 2 days before the experiment CHO cells expressing 10-20 pmol/mg protein human 5-HT<sub>2C</sub>-vsv receptors (Euroscreen) were plated at a density sufficient to yield a mono-confluent layer on the day of the experiment. The cells were dye loaded ( $Ca^{2+}$ -kit from Molecular Devices, and according to their instructions) at 37° C in a 5% CO<sub>2</sub> incubator at 95% humidity. Lazer intensity was set to a suitable level to obtain basal values of approximately 8000 RFUs. The variation in basal fluorescence was less than 10%. EC<sub>50</sub> values were assessed using increasing concentrations of test compound covering 3 decades. IC<sub>50</sub> values were assessed challenging the EC<sub>85</sub> of 5-HT with concentrations covering 3 decades of test substances. Ki values were calculated using Cheng-Prusoff equation.

**Measurements of [<sup>3</sup>H]noradrenaline uptake into rat cortical synaptosomes.**

Fresh cortex from male Wistar rats (125-225 g) are homogenized in 0.4M sucrose with a glass/teflon homogenizer. The homogenate is centrifuged at 600 x g for 10 min at 4 °C. The pellet is discarded and the supernatant is centrifuged at 20.000 x g for 55 min. The 5 final pellet is homogenized (20 sec) in this assay buffer (6 mg original tissue/mL = 4 mg/well). Test compounds (or buffer) and 10 nM [<sup>3</sup>H]-noradrenaline are added to deep 96 well plates and shaken briefly. Composition of assay buffer: 123 mM NaCl, 4.82 mM KCl, 0.973 mM CaCl<sub>2</sub>, 1.12 mM MgSO<sub>4</sub>, 12.66 mM Na<sub>2</sub>HPO<sub>4</sub>, 2.97 mM NaH<sub>2</sub>PO<sub>4</sub>, 10 mM glucose and 1 mM ascorbic acid. Buffer is oxygenated with 10 95% O<sub>2</sub>/5% CO<sub>2</sub> for 10 min at 37 °C and pH is adjusted 7.4. The incubation is started by adding tissue to a final assay volume of 1 ml. After 15 min incubation with radioligand at 37 °C, samples are filtered directly on Unifilter GF/C glass fiber filters (soaked for 1 hour in 0.1% polyethylenimine) under vacuum and immediately washed with 3 x 1 mL assay buffer. Non-specific uptake is determined using talsupram (10 µM final concentration). Duloxetine is included as reference in all experiments as dose-response 15 curve.
